Recogniform Virtual Duplex PlugIn for PaperCapture

Description

This plug-in allows to emulate a duplex scanner output using a simplex scanner. You can scan double side documents in two steps: as first step you scan front sides, then you scan rear sides. Finally using this plug-in you can rearrange the batch pages in the correct order, so that the results is the right sequence of document front page followed by document rear page, for each document.

Installation

To install this plugin just copy the files `DUPLEXPLUGIN.DLL` in the same directory where already exists the file `PAPERCAPTURE.EXE` and restarts PaperCapture application.

Usage

Make sure a batch is ready, then use the PaperCapture *Process -> Plug-In* command and in the dialog window select this plugin from the available plugin list and click on *OK*.

Settings

When the process start, is asked if your scanner ADF gives as output a stack of paper in the same input order or not (inverse stack). You can avoid this question editing the file `PAPERCAPTURE.INI` at section `[DUPLEX PLUGIN],` adding the entry `MODE=` followed by the 1 if the output stack is like the input stack, 2 if the output stack is inverted.

Example 1 of `PAPERCAPTURE.INI` settings:

```
[Duplex PlugIn]
Mode=1
```

In this sample you tell the system that the ADF gives in output a stack identical to input stack of sheets.
